Current Status of PERC

Wednesday, December 9, 2020 5:40 PM (20 minutes)

The PERC (Proton and Electron Radiation Channel) facility is currently under construction at the MEPHISTO beamline of the FRM II, Garching. It will serve as an intense and clean source of electrons and protons from neutron beta decay for precision studies. It aims to improve the measurements of the properties of weak interaction by one order of magnitude and to search for new physics via new effective couplings. PERC's central component is a 12 m long superconducting magnet system. It hosts an 8 m long decay region in a uniform field. An additional high-field region selects the phase space of electrons and protons, which can reach the downstream detector and systematic uncertainties.

The downstream main detector and the two upstream backscattering detectors, will initially be scintillation detectors with (silicon) photomultiplier readout. In a later upgrade, the downstream detector will be replaced by a pixelated silicon detector.

Delivery of the magnet system is scheduled before the end of this year. We present details on PERC's current status.

Primary authors: Mr LEBERT, Manuel (Physik-Department ENE, TUM); Ms BERNERT, Karina (Physik-Department ENE, TUM)

Co-authors: Mr HOLLERING, Alexander (Physik-Department ENE, TUM); Dr KLENKE, Jens (FRM II); Ms LEHMANN, Kathrin (FRM II); Mr LAMPARTH, Max (Physik-Department ENE, TUM); Prof. MÄRKISCH, Bastian (Physik-Department ENE, TUM)

Presenter: Mr LEBERT, Manuel (Physik-Department ENE, TUM)

Session Classification: Joint poster session of MLZ User Meeting and DN2020

Track Classification: UM: Nuclear, Particle, and Astrophysics
