Considering Instrumentation for a High Intensity Moderator at the European Spallation Source

Monday, 20 March 2023 16:00 (2 hours)

The European Spallation Source, currently under construction in Lund, Sweden, will originally make available a suite of 15 state-of-the-art neutron scattering instruments, which will be served by a high-brightness moderator placed above the spallation target. The current infrastructure of ESS, however, allows for a second, alternative moderator to be constructed and positioned below the spallation target. The second moderator is currently considered to have a larger viewable area, offering higher intensities at longer wavelengths, potentially spanning a range from Cold (4 – 10 Å) to Ultra Cold (> 100 Å) neutrons. It is assumed that several areas of condensed matter research profit from such second moderator concept, including small-angle neutron scattering, spin-echo spectroscopy, and neutron imaging. Here, we present the conceptual designs of potential instruments, mainly giving focus to small-angle neutron scattering.

Primary author: SAMOTHRAKITIS, Stavros (Paul Scherrer Institute)

Co-authors: BERGBÄCK KNUDSEN, Erik (NEXMAP, DTU Physics); BERTELSEN, Mads (European Spallation Source); STROBL, Markus (PSI); WILLENDRUP, Peter (DTU Physics)

Presenter: SAMOTHRAKITIS, Stavros (Paul Scherrer Institute)

Session Classification: Poster Session MONDAY

Track Classification: Neutron Instrumentation, Optics, Sample Environment, Detectors, and Software
