Type: Poster

## FLASH-NT - A proposal for a complementary neutron imaging instrument on a cold guide at MLZ

Monday, 20 March 2023 16:00 (2 hours)

MLZ successfully operates the two neutron imaging beam lines NECTAR and ANTARES. NECTAR provides fast fission neutrons, thermal neutrons and gammas, which can be combined for multi-modal characterization of larger samples with spatial resolution down to ~100  $\mu$ m. ANTARES offers a spectrum with a thermal maximum, extended towards cold neutrons, providing higher sensitivity and spatial resolutions down to ~20  $\mu$ m.

Many applications such as studying the water management within membranes of fuel cells of only a few µm thickness or lithium transport phenomena and dendrite growth in batteries require highest possible spatial resolution for small samples, combined with a true cold neutron spectrum for highest contrast and high flux. Moreover, many scientific questions requiring modern and advanced imaging techniques (e.g. nGI, Bragg edge imaging) would strongly benefit from a broader spectral range and a colder spectrum.

We propose to build a complementary neutron imaging instrument at a neutron guide end position providing a small beam cross section and a cold neutron spectrum, combined with an extremely low background. The instrument should be optimized for applications requiring highest possible spatial resolution down to the single  $\mu$ m range and applications using advanced imaging techniques that will benefit most from the broad spectral range and the low background at a neutron guide, thus adding new possibilities to the portfolio of neutron imaging applications at MLZ.
