A newly crystallized structure of human formylglycine-generating enzyme

Wednesday, 16 March 2022 18:44 (1 minute)

The formylglycine-generating enzyme (FGE) plays a key role in the posttranslational modification of the active site of all known human sulfatases. Previously crystallized structures of FGE are missing a surface loop that had to be cleaved off prior to crystallization. Here, we report the first crystallization of human FGE including this loop.
