EIGER2 CdTe - Hybrid Photon Counting for a wide range of X-ray energies

Wednesday, 16 March 2022 14:50 (20 minutes)

Hybrid Photon Counting (HPC) allows for direct detection of X-rays in single-photon counting mode. HPC provides a number of benefits such as a sharp point-spread function, the absence of detector background, and outstanding dynamic range. High-Z sensors enable high quantum efficiencies for high X-ray energies and bring the benefits of HPC to hard X-ray applications. This presentation outlines the features and advantages of EIGER2 CdTe and shows examples of the benefits of HPC with CdTe sensors.
