## Neutron Depth Profiling at a focused neutron beam to study Li-ion transport in thin-film batteries

*Monday, 17 September 2018 17:45 (15 minutes)*

In operando observations of Li transport in all-solid-state thin-film batteries during fast (dis)charge cycling, as well as the study of mechanisms of battery aging become possible at a new Neutron Depth Profiling (NDP) setup of JCNS, using the focused neutron beam of reflectometer MARIA (MLZ). This arrangement allows for sufficiently high counting rates necessary for fast, about tens of seconds, measurements under the requirement of a fine, of an order of 10 nm, depth resolution.

**Primary authors:** IOFFE, Alexander (JCNS); Mr CHEN, Chunguang (3Institute of Energy and Climate Research, Fundamental Electrochemistry (IEK-9), Forschungszentrum Jülich GmbH); Dr DANILOV, Dmitry (Institute of Energy and Climate Research, Fundamental Electrochemistry (IEK-9), Forschungszentrum Jülich GmbH); VEZHLEV, Egor (JCNS); NOTTEN, Peter (Eindhoven University of Technology, Netherlands, and Forschungszentrum Jülich, Germany); Prof. EICHEL, Rüdiger-A. (Institute of Energy and Climate Research, Fundamental Electrochemistry (IEK-9), Forschungszentrum Jülich GmbH); MATTAUCH, Stefan (FZ-Jülich); BRÜCKEL, Thomas (Forschungszentrum Jülich GmbH)

**Presenter:** VEZHLEV, Egor (JCNS)

**Session Classification:** Poster session 1

**Track Classification:** MS1 In-situ and in-operando studies with special focus on energy materials and catalysis
